# HONG KONG PRISONS USES WILDFACES TO ENSURE SAFETY AND SECURITY

NEWSLETTER OF WILDFACES.AI

Inside this issue

Prisons have a role in society to ensure prisoners are kept secured. In a modern society they also have a responsibility to ensure that prisoners themselves are safe.

WildFaces has been working with the Hong Kong Prisons to detect behaviors such as fighting in the cells, attempted self-harm and suicide attempts and unusual behaviors that could affect the effective functioning of the prison. In the attached video the customer himself tells you how they are using the system. See **video**.

Partners/ Resellers Recruitment Drive

WildFaces' sales strategy has been to drive business in Hong Kong first and then spread out to all the other countries which would want its capabilities. In Hong Kong a sales pipeline of nearly **US$250 million has been established**. The first batch of projects have already been deployed and customers are moving to the next stage. This pipeline includes customers involved in smart buildings, transportation, government & law enforcement organizations. This initial pipeline was established directly but to grow the potential market faster, the company is looking for partners to extend its reach.

To confidently share the leads generated through our marketing programs we are looking for partners who fulfil the following characteristics:

· Have a commitment to innovation
· Have a dedicated sales and support team.

FACE RECOGNITION ON-THE-MOVE

Face Recognition with a Difference

With so many Face Recognition systems around what makes WildFaces different? See **video**.

WildFaces Technology offers a comprehensive vision-based Artificial Intelligence (AI) software system that can be used to help customers increase their productivity across 30+ industries. The algorithms can be easily adapted to new use cases.

The company owns the "On-the-Move" Recognition domain as the underlying technology has been patented. This technology can recognize and track hundreds of faces **anonymously** in real-time from a range of moving IoT gadgets (e.g. drones, walking robots, wearables etc).

The technology is very computing light and does not require expensive GPUs.

And most importantly, unlike many so called "unicorns", WildFaces has its own core technology. It is therefore unaffected by the "trade war" rhetoric between the USA and China or the US export controls on their AI and GPU technologies.

WildFaces Makes a Stir in Dubai

January started off with WildFaces making its debut in the Middle East market by participating in Intersec in Dubai, the largest security show in the Middle East. It generated enormous interest and many new contacts were established which we will now work on converting to resellers and customers.

WILDFACES CONTINUES TO WIN AWARDS
